What causes generator rotor imbalance?

Generator rotor imbalance can come from a number of different sources, i.e. coupling misalignment, component non-concentricity, rubbing, oil issues, bearing, and journal issues. Each has unique characteristics. Thermal sensitivity has its own recognizable characteristics.

Why does my generator run rough?

The purpose of a fuel filter is to ensure that dirt and debris-free fuel should be transported to the carburetor. Over time the small pores that hold the dirt become clogged and restrict the flow of fuel to the carburetor causing the generator to run rough. Solution: Clean or Replace the Fuel Filter.

Why is my generator rotor bowing out?

Improperly positioned blocking can cramp or restrict this axial growth, thus causing a bow in the rotor body. A generator rotor that demonstrates thermal sensitivity caused by creepage or distance blocking issues will bow out on the same side as the restriction.
